Maybe i am not aware of these in ide,
but i find them quite usefull - especially with so little piece of code:

```
>>+=-----  
mousewheel, numLinesToScroll read from system:  
at Assist.cpp void AssistEditor::MouseWheel(Point p, int zdelta, dword keyflags)  
int slines;  
SystemParametersInfo(SPI_GETWHEELSCROLLLINES, 0, &slines, 0);  
...  
CodeEditor::MouseWheel(p, zdelta*slines, keyflags);
```

```
>>+=-----  
when same char }}" ahead_written - it's jumped over:  
if((code=='')||code=='|'||code=='{'||code=='"') &&  
code==GetChar(GetCursor()))SetCursor(GetCursor()+1);  
at CodeEditor.cpp: if(code >= 32 && code < 128 && count == 1) {
```

This is from sources v7936

I have fixed the first issue (but correctly - your code is not platform independent). It is in trunk now.

I am not sure whether I like the second issue. Is there any mainstream editor that provides this behaviour?

I am now as luoganda, since smxxms didn't work any more, could not log in nor reset password/settings,
so as far as i am concerned that profile can be deleted.
By the way, i don't know why, but using `www(dot)gmx(dot)com` mail cannot be used with this,
so i had to use g-mail.

Anyway,
__that proposal was added because when using 'tab' to autocomplete function,
__ending ')' is added to it, and you must skip it with right key.
__If there was an option to prevent adding last ')' char this would not be here.
__Not adding ending closed tag ')' or doing it the way it's been proposed is faster.
Maybe an option in settings or something, maybe there is - but i am not aware of it.
