i built an app with theide on Ubuntu 14 and copy it to Ubuntu 12.
Then it complains
/usr/lib/x86_64-linux-gnu/libstdc++.so.6: version `GLIBCXX_3.4.20' not found
How to compile a bin to be used on other versions of Linux?

Why not????

google with the words:

 compile chroot environment LD_LIBRARY LD_LIBRARY_PATH

and YES, Welcome to LINUX!!!

This time, I have my app built with a recipe on Launchpad for Precise.
On my Precise 12.04.4, I install this app but it still has this error.
It works on the other Precise of mine, 12.04.5.
But on both machines, "strings /usr/lib/x86_64-linux-gnu/libstdc++.so.6.0.16 |grep GLIBC"
produces no GLIBCXX_3.4.20.
Both gcc 4.6.3.

This post said I can link the lib to my app with -static-libstdc++
http://   stackoverflow.com/questions/19386651/how-to-fix-usr-lib-libs
tdc-so-6-version-glibcxx-3-4-15-not-found
If so, how to add it to my umk command to build the app?

Thank you very much.

You can add it to your GCC.bm, in the RELEASE_LINK option.

Honza

the generated bin becomes larger, 1100k from 900k.
but it still complains "/usr/lib/x86_64-linux-gnu/libstdc++.so.6: version `GLIBCXX_3.4.20' not found"

seems my libc is not installed complete. not all packages are of the same version. Some is newer, which makes it want to find 3.4.20.
So, I will try to turn those to the lower version again.
Anyway, the static link idea does not work, maybe because I am still using a dynamic library depending on libc.
