Subject: how to compile source files and create shared lib.

HI-

I am trying to find an example to compile like this (any links I can read please?) I can check syntax in IDE but then have to go outside IDE
to make shared file. I put my .cpp, .h, in upp package directory by including
them. There are 20 or so .cpp files. I am compiling and building IBPP
for firebird. It links inside upp with message 'ok'. Any cool tips are appreciated!

```
CC = g++

CFLAGS      = -fPIC -pedantic -Wall -shared
DEBUGFLAGS   = -O0 -DIBPP_LINUX -DIBPP_GCC -std=c++11

INCLUDES = -I../ibpp_headers

LFLAGS = -L../fb_libs -L/usr/lib/x86_64-linux-gnu
LIBS = -lfbclient -lm -lpthread -lcrypt

SRCS = array.cpp blob.cpp database.cpp date.cpp dbkey.cpp \
_dpb.cpp events.cpp exception.cpp _ibpp.cpp _ibs.cpp \
 _rb.cpp row.cpp service.cpp _spb.cpp statement.cpp \
 time.cpp _tpb.cpp transaction.cpp user.cpp \

OBJS = $(SRCS:.c=.o)
TARGET  = sqlFB.so

all: $(TARGET)

$(TARGET):  $(OBJS)
 $(CC) $(CFLAGS) $(DEBUGFLAGS) $(INCLUDES) -o $(TARGET) $(OBJS) $(LFLAGS) $(LIBS)

.c.o:
 $(CC) $(CFLAGS) $(INCLUDES) -c $<  -o $@

clean:
 $(RM) *.o *~ $(TARGET)

depend: $(SRCS)
 makedepend $(INCLUDES) $^

# DO NOT DELETE THIS LINE -- make depend needs it
```

Hi-

I am going to look at umk first.

thanks

I am glad I can use synaptic and read it. Umk was going to try to wipe out theIDE. I can't find out how to build a shared library file in U++. I will search a little more but not too much longer. I hoped to do everything from within the IDE. Not sure if it can be done "by me".

thanks

Hi-

Does anyone know the syntax to run a makefile in custom build? Can you give a minimalist example is possible?

thanks!

Hi mtdew3q,

Quote:I am glad I can use synaptic and read it. Umk was going to try to wipe out theIDE. This is because umk is also in the package called theide, you should already have it installed.

Now, to the problem itself. Are you trying to create a U++ package for IBPP? Did you check the Firebird package in bazaar? It might save you some trouble, if you just need this to access firebird...

There are two ways you can use to run custom code from TheIDE. If it is ok to run them manually, you can use macros. If you need it as automatic part of the build process, then there are the custom build steps, You'll probably need to create the shared object in "pre-link" phase.

Best regards,
Honza

Hi-

I followed the link to the macro. I kind of get the mini scripting language. I couldn't figure out after I create the macro where to put the .usc file and how to execute it though.

Where is the common or local directory? I think they are bound to a key combination... right?

For i.e. this code goes in .usc file but how to execute it? Thanks for elaborating!

```
macro "Insert current date" {
    s = [];
    tm = GetSysTime();
    s << to_string(tm.year) << "-" << to_string(tm.month) << "-" << to_string(tm.day);
    .Insert(s);
}
```

I just found in editor mode where to put the path.

thanks for helping!

Where is the common or local directory? I think they are bound to a key combination... right? Just put the *.usc file in your pacakge.

You can bind a keyboard shortcut to the macro, or you can execute it via Macro menu, which appears in theide as soon as you have any package containing usc file in your project.

okay-

that works really cool.

THANKS Honza 8)
