Subject: Basic package requirements

Hello All,

I am brand new to Ultimate++. Starting with a new, empty package, I'm trying to build of the 'Hello World' example from the help file.

I've managed to eliminate most of the unresolved externals by adding the Core, CtrlCore, and CtrlLib packages, but the linker still can't find "\_main":

LIBCMTD.lib(crt0.obj): error LNK2019: unresolved external symbol \_main referenced in function \_\_tmainCRTStartup

What package do I have to include to get \_main? (I'm working in Cygwin/MinGW on a 64 bit Windows machine, if it matters.)

Thanking you all in advance. Jeff

(By the way, sure would be nice if the IDE would allow me to copy build error messages to the clipboard rather than having to type them by hand.)

You need to add code below to one of your cpp-files.

```
#include <Core/Core.h>
CONSOLE_APP_MAIN
{
}
```

Take a look at several icons in the right-down corner (you can also try to press ESC button several times to open/close this panel). One of the icons is called "Console". Click on it. This is probably what you are looking for.

Another useful thing is a check-box Setup --> "Be Verbose".

Hope this helps.

Another possible reason is that you need to have "GUI" in your main package config.

The reason is that Win32 builds GUI apps differently from console apps, that is why builder needs to know that you are building GUI.

(Package/project creation 'wizard' completely setups all necessary, but I guess you know this trying to recreate the process from the scratch to understand details, which I applaud...:)

Mirek

Ah yes. That's it: the GUI flag. Thanks, Mirek.

Jeff
