I am happy to announce that I have just merged experimental Android builder to TheIDE,

It is still experimental (frankly, so far I have only tested that it has not broken TheIDE :), anyway according to docs, you should be now able to build android apps in TheIDE.

Note that this is only about the builder so far, no work was done on libraries yet.

It sounds great :). However, how far are we from Android application development?

Maybe later this year....

More or less, what has been done and what are the components that have to be done?

koldo wrote on Wed, 08 July 2015 11:23More or less, what has been done and what are the components that have to be done?

This is builder, it means you should be able to develop android apps (mixed Java/NDK) in TheIDE. Packages work as we are used to, being transformed into android build system

structures.

No work has been done on library yet.

Very interesting, excellent!. Maybe in few months we will see a Hello World :)

Hello koldo,

"Hello world!" example is on the upp trunk (trunk/examples). It name is "AndroidMath".

The example is on the site. Below is links to them: (for some reasons java files are still not visible):
AndroidMath - Main package that shows how to mix Java & C++ in Android project. It also shows how android project structure works with TheIDE.
AndroidMathUtility - pure C++ supportive package.

Please notice that this example doesn't use any upp components only standard c++ library.

Moreover android builder configuration is also written. You can find it in the latest upp version (Help -> "Working with Android builder"). I wish it will be available on upp site.

Sincerely,
Klugier

Cool!

May be it is good idea to add Android projects to templates.

Hello Mindtraveller,

Application template is already implemented ;). Catch screen-shot:

Please notice that this is related to SDK (pure Java development). Maybe in the future I will add NDK template base on native activity. But firstly I should know how it works and what can you do with that. From version 8675 android builder can handle only c++ code.

Porting upp/Core to Android has now biggest priority as well as writing documentation ;).

Sincerely,
Klugier

Hello,

I just added screen-shot from Android device. It is available on AndroidMath example site:
[http://www.ultimatepp.org/examples\\$AndroidMath\\$en-us.html](http://www.ultimatepp.org/examples$AndroidMath$en-us.html).

Sincerely,
Klugier

Hello one more time,

Finally, I found the way how can I attached documentation into upp website. So, "Working with Android builder" is now online. Here you can check it:
[http://www.ultimatepp.org/app\\$ide\\$AndroidBuilder\\$en-us.html](http://www.ultimatepp.org/appideAndroidBuilder$en-us.html).

Sincerely,
Klugier

Hello,

It is possible to run apk build by TheIDE inside Google Chrom browser. Here is tutorial how you can mod chrom to do this: <http://www.howtogeek.com/214734/how-to-use-googles-arc-welder-to-run-android-apps-in-chrome/>. At the end you will need to specific path to apk created by TheIDE.

Below is the screen-shot that shows how this look like in desktop system:

Sincerely,
Klugier

GREAT! :p

I was just looking for a decent android build environment.... and didn't find it.
So far the "best" is QT, but it has too many caveats and the license is a big problem.

Is there an estimate timeline for completion ? Can I help somehow ? Not skilled at all on android, but I can try to learn it :)

Ciao

Max

Hello Max,

I will tell you the truth. I was working on Android Builder during my studies and it is my Master Thesis :) So, the whole architecture is well documented (around 40 - 50 pages), but only in Polish. Current status is well described in this topic and in attached links. The best way to test Android Builder is to configure build method and build Android Math example.

What should be done in the future?

- Improvement in IDE infrastructure (reading logs from device via "adb logcat", debugging through jdb, ndk-gdb etc.)
- Improvement in Android Builder - support for unit tests - should speed up development process (We need some kind of TDD)
- The IDE should be able to launch App directly in emulator
- Gradle integration (I think we should use some kind of Java make - for example Qt uses Ant). Currently we compile Java sources in single thread.
- Porting Core (It shouldn't be hard - I ran it with simply commenting code - but some things may need improvements like language support!!!)
- Writing GUI back-end for Android (How should we implement Android activities???)
- Implement native drawing through canvas or OpenGL ES
- OpenGL ES support
- Ultimate++ should support GUI containers like Grids, LinearLayout etc.
- Android high DPI support (I think it shouldn't be hard to implement due to current changes in Draw) - Smart-phones with 4k display :)
- JNI support we need to call Java code from cpp and vice versa.
- Probably a lot of more things that I forgot to enumerate.

Optional tasks:

- Support for things like accelerometer, video camera etc (Optional).

As you can see U++ with Android is huge project. And it will require a lot of time. That I actually do not have. Currently I am working as a full-time developer in one of local company. But if someone or a company wants to pay for my job on Android Builder and Android app integration - I'm open to suggestions. Even if it would be one day per week.

Currently I am posting small patches like Xml indent support for IDE:

- <http://www.ultimatepp.org/redmine/issues/1353#change-2790> (Should be usfull for editing Android manifest file :))

P.S.

If you want more information we can talk on Skype.

Sincerely,
Klugier

I see, quite an huge job to do.

As you say, I guess that core porting should not be so difficult (not too easy, either).

But the rest is not easy at all.

It's a pity that I don't have enough skills on Android to do some part... I could try something, but my time is also scarce.

Anyways, the job you did up to now is really awesome ;)

I'm coding a couple of small apps with QT, but I really miss the comfort of UPP.

Ciao

Max

Hello all,

I manage to compile Core on Android (small fixes are required - <http://www.ultimatepp.org/redmine/issues/1304>). Please notice, that this changes are not merged into trunk. Of course I ran several of Core functionality like HttpRequest. Small screen-shot from device (www.ultimatepp.org page was downloaded via HttpRequest):

I plan that initial version of Core for Android should be available in 2016.1 upp release.

Sincerely and thanks for support,
Klugier

Hello,

The good news from the Android sandbox is that our builder support BLITZ technology for both POSIX and Windows.

Sincerely,
Klugier
