Hi, at last I have my OSX machines working...

So, if you want to build theide 8227 for X11 on Mavericks.

Installation:

1. Install XCode 6.2
2. Install Macports
3. Install XQuartz
4. Install zlib, glib2, libpng, libnotify, freetype, Xft2, atk, gtk2 via sudo port install [name]
5. Download upp stable 8227 for linux (tested).
6. Replace the Makefile (attached here)

Changes in sources needed:

1. Core/TimeDate.cpp

```
bool SetSysTime(Time time)
```

```
{
```

```
#ifdef PLATFORM_POSIX
```

```
    struct tm    tmp_time;
```

```
    tmp_time.tm_sec = time.second;
```

```
    tmp_time.tm_min = time.minute;
```

```
    tmp_time.tm_hour = time.hour;
```

```
    tmp_time.tm_mday = time.day;
```

```
    tmp_time.tm_mon = time.month-1;
```

```
    tmp_time.tm_year = time.year-1900;
```

```
    time_t raw_time = mktime(&tmp_time);
```

```
    struct timespec sys_time;
```

```
    sys_time.tv_sec = raw_time;
```

```
    sys_time.tv_nsec = 0;
```

```
#ifdef __MACH__
```

```
#include <sys/time.h>
```

```
    localtime(&raw_time); //aris002 BUG TMP!!! HACK to compile!
```

```
    return true;
```

```
#else
```

```
    int result = clock_settime(CLOCK_REALTIME, &sys_time);
```

```
    return (result == 0);
```

```
#endif
```

```
#endif
```

2. plugin/ndisasm/lib/inttypes.h

```
/* long is 64 bits */
```

```
#ifdef __APPLE__
```

```
    typedef long long int64_t;
```

```
typedef unsigned long long uint64_t;
#else
typedef signed long int64_t;
typedef unsigned long uint64_t;
#endif
```

3.plugin/ndisasm/lib/compiler.h

Need to test on other versions than Mavericks

but now just comment:

```
//#ifdef __APPLE__
//#define _FORTIFY_SOURCE 0 //aris002 - in the future evaluate how unsafe are the safe
functons and vice versa
#endif
```

[At the moment theide runs but can't build. Need to have a look into \*.bm and ide/Builders/... ]

Edited: It builds now! please find the files below:

1. GccBuilder.icpp
2. CLANG.bm
3. Core.upp

Also, need sort out SetSysTime. Ideas?

Other ideas? Anyone to test?

P.S. Fingers crossed, I will have a few weeks to work up mac OSX and cocoa.

Wow, welcome back!

As for changes, both SetSysTime and ndisasm are of no consequence for theide (ndisasm is only used when debugging Microsoft C++ compiler output).

What are problems with building?

Mirek

mirek wrote on Mon, 20 July 2015 07:54Wow, welcome back!

Mirek

Thanks a lot for the welcome! And sorry for the long absence...

There have been several problems with building. No 1 - quotes in linking library paths. I will post the rest later (now writing from my phone)

Core.upp requires some changes:

library(LINUX) "pthread dl rt";

library(BSD !OSX11) "pthread rt execinfo";

library(OSX) pthread;

Hi Aris!

happy to "see" you again :)

It depends by your efforts on porting U++ on MAC if one day I'll buy one.

Luigi

Hi Aris,

Nice to have you back on the Upp forum!

Best regards,

Tom

Hello Aris,

You can handle your Mac OS X issues on redmine. I have create special "Mac OS X" category to distinguish this issues. It is definitely better way to track your patches, than putting it on this forum. You will know what is fixed and what should be fixed in the future. Of course you can put instructions here. It can be more attractive for community than redmine.

I wish you successes on your way to port upp on Mac OS X. It would be great thing if upp will be full support on Mac without X11. Good luck!

Sincerely,  
Klugier
