As demonstrated by new reference example:

```
#include <Core/Core.h>
#include <build_info.h>

using namespace Upp;

CONSOLE_APP_MAIN
{
 StdLogSetup(LOG_COUT|LOG_FILE);

#ifdef bmTIME
 LOG("Compiled " << bmTIME << ", " << (GetSysDate() - (Date)bmTIME) << " day(s) ago");
#endif
#ifdef bmUSER
 LOG("Compiled by user " << bmUSER);
#endif
#ifdef bmMACHINE
 LOG("Compiled on machine " << bmMACHINE);
#endif
#ifdef bmSVN_REVISION
 LOG("Svn revision " << bmSVN_REVISION);
#endif
#ifdef bmSVN_REVISION
 LOG("Svn url " << bmSVN_URL);
#endif
}
```

Is it possible to add an UPP_SVN_VERSION (version of UPP that was used to build a package)
to a list of defines?

TIA

TIA

Maybe. Not well defined though...

One possible algorithm is to scan through nests for one ending with 'uppsrc' and get svn version of that. Disadvantage there is that it would work only if uppsrc is svn checkout...

Even this is much better than nothing. IMHO, everybody who is using UPP is using an SVN version of UPP.

Thanks.
