Hi,

I found following comments in another forum:

-> You can use AS for table aliasing on many SQL servers (at least MsSQL, MySQL, PostgreSQL) but it's always optional and on Oracle it's illegal.

So, I changed the following Code:

----- SqlStatement.cpp -----

```
SqlSet SqlSelect::AsTable(const SqlId& tab) const
{
    StringBuffer t;
    t << SqlCase(MSSQL|PGSQL, "")("(")
      << "(" << text << ")" " << SqlCase(ORACLE, "")("as") << " \t" << tab.ToString() << "\t'
      << SqlCase(MSSQL|PGSQL, "")("(");
    return SqlSet(String(t), SqlSet::HIGH);
}
```
