Subject: [FIXED] OpenGL / GLDrawDemo crash on Linux Ubuntu

Hi,

I've started testing OpenGL support in U++ (svn version) under Linux Ubuntu 15.04. It is succesfully compiled with NOGTK flag but crashes during runtime in Upp::CreateXftFont() function. I'll investigate it and try to prepare the patch to solve the problem.
But if someone is aware of possible cause of this problem, please let me know. It will make things faster and easier.

Thanks

I have same results. We must set NOGTK flag in SDL applications. But it's run with no errors on earlier SVN versions of uppsrc.

I use NOGTK as temporary solution.
