Hello,

We have an application that we are compiling w/ CLANG using theide.
There are so many warnings in our code and we need to closely examine and resolve.
I wanted to share some of these with my peers at work and the
easiest way is to produce a log-file of the compilation for them to look at.

How can I obtain a log-file of the compilation/link of our app using theide?

Hi Jeff,

You can simply copy it from the Console (the pane under code editor, it's the second tab from top) after compilation. Simple ctrl+a and ctrl+c should be enough.

Also, it might be a good idea to turn on verbose mode and/or clean your packages, so that you have a full report.

Best regards,
Honza

PS: You could also run the compilation from command line, using umk, which puts all the output on stdout. But that is unnecessarily complicated, unless you want this process automated.
