Hi there,
I have a MySQL backend with a table containing a TEXT field. User put data into MySQL through a window with some fields. The TEXT field is mapped to an EditString field. It works nicely, but I cannot find the way to "expand" the input in multiple lines. What is the way to do that?
Regards,
Gio

Use DocEdit or LineEdit instead of EditString.

Thanks... the solution was under my nose and I did not see it. :blush:
