Subject: MySql, boolean values and SqlArray

Hi there,
MySql rdbms do not have a boolean value type. According to the current documentation BOOL or
BOOLEAN "types are synonyms for TINYINT(1). A value of zero is considered false. Nonzero
values are considered true" and that should be used to store boolean values. I noticed that this
introduce a little problem. For instance, I have a table containing machinists IDs and a bunch of
tinyint fields: if the field is "true" (i.e. nonzero value) the machinist can operate a certain machine. I
tested it putting some values:

ID Name M1 M2 M3
'001' 'Titus' '1' '0' '2'
'002' 'Caius' '0' '1' '1'
'003' 'Sempronius' '1' '0' '0'

According to the documentation the following query should return 001 and 002: "Select ID, From
MACHINISTS Where M3 = true;", but actually it returns only 002. If I use the following query:
"Select ID, From MACHINISTS Where M3 is true;" I get correct results, i.e. 001 and 002. So
MySql is picky, but is coherent.

Get back to Ultimate++ now. I have a SqlArray control that manages that table. I need to edit the
M1, M2, M3 fields. So I used lines like the following:

EditInt m01abil, m02abil, m03abil;
[...]
tblMachinist.AddColumn(M1, "Abil. M01",10).Edit(m01abil);

And that's fine, but when I query the db:

query * Select(ID, NAME).From(MACHINISTS).Where(M! == true);
while (query.Fetch())
{
 Oper1.Set(i, (String)query[ID], (String)query[NAME]);
 i++;
}

I get just 002. So if the user puts 2 instead of 1 there are problem. To solve that I modified the
code managing the SqlArray. Now it reads (note the type of variables):

Option m01abil, m02abil, m03abil;
[...]

tblMachinist.AddColumn(M1, "Abil. M01",10).Edit(m01abil);

I tried to declare in the .sch files the M1 fields both as BOOL and INT, but every time I have problem querying the db: if M3 is not 1 it is considered false.
Using an option type to me solved the issue, as users can not put values different from zero or one.
I do not know if ultimate++ can manage this kind of issue, but as I spent some time to figure this out I decided to share my solution.
Regards,
Giorgio

If I use the following query: "Select ID, From MACHINISTS Where M3 is true;" I get correct results, i.e. 001 and 002. So MySql is picky, but is coherent.

Have you tried this which you have stated. Which is working.

query * Select(ID, NAME).From(MACHINISTS).Where(M1 is true);

It may be good idea to check first with "select *" and confirm your table is updated.

query * Select(ID, NAME).From(MACHINISTS).Where(M1 is true);

Uhm, it does not compile, I get an error.

error C2146: syntax error: ')' missing before the identifier 'is'

Try some thing like this

query.Execute(select ID, NAME from MACHINISTS where M1 is true);

bool types in SQL are bit of mess. That is why I am usually using single char value there.

However, this should work fine. I believe that the issue here is that

query * Select(ID, NAME).From(MACHINISTS).Where(M1 == true);

gets converted to

query * Select(ID, NAME).From(MACHINISTS).Where(M1 == 1);

Fix is easy, use

query * Select(ID, NAME).From(MACHINISTS).Where(M1 > 0);

(Note that when developing SQL, it is always a good idea to have activated SQL log at least in debug mode - SqlSession::SetTrace())

Hi Mirek,
thank you for your answer; my humble proposal is that Ultimate++ converts automatically "Where(M1 == True)" to "Where(M1 > 0)" in case the variable is defined as boolean in the .sch file.
Regards,
Gio

I understand this is frustrating, unfortunately there does not seem to be a good way around SQL bools at the moment. What you suggest would likely bomb other expression forms.
