
Subject: about the behaviour of the Split() function

Hello,

the Split() function is helping me to parse a record. Just now I discovered that the number of fields in a record/row to be parsed

```
Vector<String> field = Split( playerstr, ';');  
n = field.GetCount();  
...
```

doesn't consider as a field the case of consecutive ';' . So while I believed (and wanted) that the string

"aaaa; bbbb; cccc;;eeee"

had 5 fields, Split() instead counts only 4. Is it normal?

Luigi

Yes:

```
Vector<String> Split(const char *s, int chr, bool ignoreempty = true);
```

Note the additional "ignoreempty" parameter and its default value...
