Hello,

I'm using an external library that write Excel file (LibXL).

In many functions it uses

wchar_t

as argument. My string are instead simple String although UTF8 encoded. The result is that in the Excel file the accented characters are not displayed correctly.

I tried to convert String to wchar_t but my temptive ended in compiler complains. Is there a way to transform a String in a wchar_t?

Is WString related to wchar_t?

Moreover this library uses to denote a string in this way: L"mystring". My MSCV compiler complain although I included
<wchar.h>. Do we have an UPP equivalent of this weird stuff?

Thanks,
Luigi

This should work, as long as sizeof(wchar_t) is 2:

```
String s;
```

```
....
```

```
WString h = s.ToWString();
```

```
wchar_t *t = (wchar_t *)~h;
```
