Hi all,

based on Klugier idea and link (using registry)
and Koldo idea (using last version if more than one exist)

i have reworked the InstantSetup().
with this patch, VS14 & Kit10 are detected in milliseconds.

here the algorithm:

get the list of all installed Windows SDK filter this list to get the last one go to his "Include" subdirectory and find the last uap version installed, that contains "um/adhoc.h", "ucrt" and "shared". combine this and set bin,lib and include variable.

Mirek, please test and review this solution.

Patch updated .

the old version does not work with 64bit compiler because of the registry separation between 32bit and 64bit executable.

this version enumerates both : the actual (64/32), and the other (32/64).
