Hello,

In the previous week, I was trying to implement simply test runner for Google Test using Esc. This task was hard - but possible with minor TheIDE modification. In this topic I proposed two methods in redmine topic - here is the link: #1540.

GetLineLength(line) - Methods returns numbers of chars in concrete line - line parameters:

Example:

```
myLine = 20;
myLineLength = GetLineLength(myLine); // <- Will obtain length of 20-th line.
currentLineValue = Get(GetLinePos(myLine), myLineLength); // <- Will obtain the whole line into
the string
```

Target() - Returns current target

Exaple:

```
target = Target();

// Below line should work - however there is a bug in esc that i cannot equals to 0!!! (Should be fix
in the near future)
if (count(target) == 0) {
    Echo("Target is unknown. You need to build your project first");
    return;
}

Execute(target + " " + "--gtest_filter=" + myFilter);
```

The funniest thing here - is that it prints program output directly on TheIDE console :)

What do you think about that? If you have any proposition about improvements in TheIDE API - you can post it here.

Documentation:
- TheIDE API - Documentation (I made small update here today - it should be updated in the next day)

Sincerely,
Klugier
