Hi,

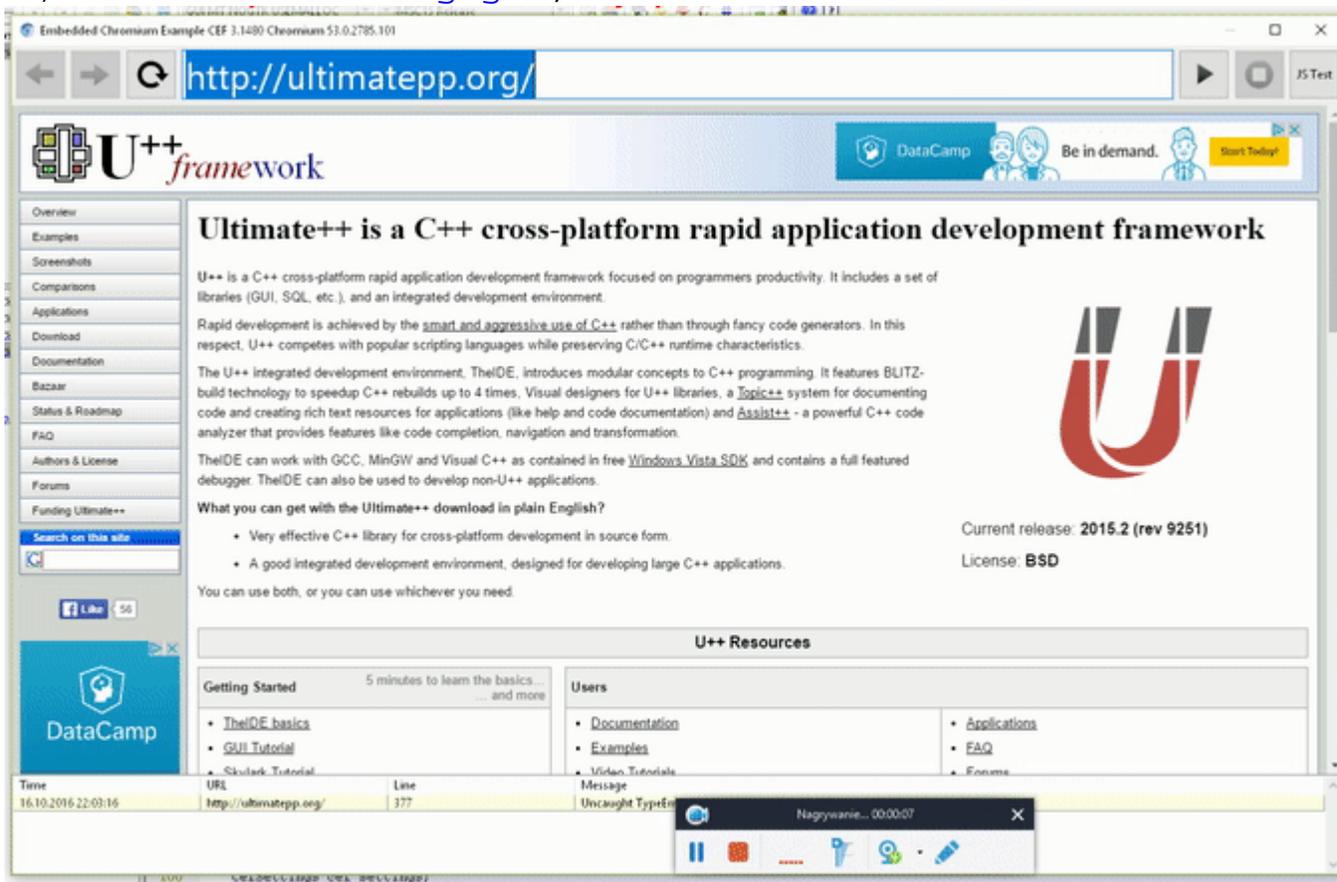

Is there any way to disable background redrawing by Ctrl class in my own widget? I tried to call `BackPaint(NOBACKPAINT)` in my widget constructor, but to no avail. Resizing chromium browser example from bazaar looks like this:

Source code: <https://github.com/ultimatepp/mirror/tree/master/bazaar/ChromiumBrowser>

How does `DHCtrl` class avoid flickering?

Hi,

NOBACKPAINT actually means something else: Do not use back buffer to avoid flickering.

It is completely completely ignored with DHCtrl.

Now for your issue: This will be more related to improper implementation of Chromium. Recently, I needed browser in one of my apps, I have started with Bazaar IE package, but found somewhat similar issues (flickering). I was able to fix them by fixing the package. I guess something like that is needed for Chromium Browser package....

Thanks for explanation.

Right now I override State(int reason) function from Ctrl and when size or position is changed I call Layout function to set everything:

```
https://github.com/ultimatepp/mirror/blob/master/bazaar/ChromiumBrowser/ChromiumBrowser.cpp
```

Windows code responsible for chrome position and size looks like this (flickering visible):

```
CefWindowHandle hwnd = handler->GetBrowser()->GetHost()->GetWindowHandle();
HDWP hdwp = BeginDeferWindowPos(1);
hdwp = DeferWindowPos(hdwp, hwnd, nullptr, r.left, r.top, r.Width(), r.Height(),
SWP_NOZORDER);
EndDeferWindowPos(hdwp);
```

Or second version (flickering visible):

```
SetWindowPos(hwnd, NULL, r.left, r.top, r.GetWidth(), r.GetHeight(), SWP_NOZORDER);
```

In third version I disabled it completely, so chrome doesn't change its size when I resize application window, but flickering is still visible.

The funny thing is, that with X11 backend flickering is not visible.
