
Subject: Question about Drag and Drop

Hello,

When I choose to use the DND_EXACTIMAGE flag in a call to DoDragAndDrop, how can I make a visual difference between a DND_COPY and a DND_MOVE operation?

Would it not be better to have an overloaded version of this function, accepting two images (or even three, one more for the 'no drop allowed')?

Or do I overlook something?

Regards

Frank De prins

Nope, it just looks like you are the first one using EXACTIMAGE :) You are right, this needs fixing.

Which would be better? 3 images, or compositing drop flags over single one? Personally, I would prefer later...

Well, I must say I preferred the first one.

I already tried it out, locally (only for Windows, though) and what I did was:

Change the current version with one image to 3 images and change the code to use the right image for each of the 3 actions.

Add a new version with one Image (conform to the old, unmodified, one) that just calls the modified one with 3 times the same image. That way, old code is not broken.

I think having 3 images gives the most flexibility.

I attached a patch file to show my mods.

Now thinking about it: best would be do both. Provide ability to provide 3 images, then create images if they are Null. Would be nice even for !EXACTIMAGE.

Great. But then the const Image& would become const Image*. Not so?

Ah no, you said Null, not NULL or nullptr.
