I propose this variant of function SetTime(Time) (file Core/TimeDate.cpp)

```
bool SetSysTime(Time time)
{
#ifdef __ARM_EABI__
    struct tm mytime;
        struct timeval garfield;
        time_t new_time;
    int result_t;

//Set Time struct
mytime.tm_sec = time.second;    // Seconds
mytime.tm_min = time.minute;    // Minutes
mytime.tm_hour = time.hour+1;    // Hours
mytime.tm_mday = time.day;    // Day of Month
mytime.tm_mon = time.month-1;    // Month
mytime.tm_year = time.year-1900;    // Year

    new_time = mktime(&mytime);
    garfield.tv_sec =new_time;
    garfield.tv_usec=0;

    result_t=settimeofday(&garfield,NULL);
    if(result_t<0)
    {
        fprintf(stderr,"Error setting the Time.\n");
        return false;
    }
    else
    {
        return true;
    }
#else
#ifdef PLATFORM_POSIX
    struct tm    tmp_time;
    tmp_time.tm_sec = time.second;
    tmp_time.tm_min = time.minute;
    tmp_time.tm_hour = time.hour;
    tmp_time.tm_mday = time.day;
    tmp_time.tm_mon = time.month-1;
    tmp_time.tm_year = time.year-1900;
    time_t raw_time = mktime(&tmp_time);
```

```
struct timespec sys_time;
sys_time.tv_sec = raw_time;
sys_time.tv_nsec = 0;

int result = clock_settime(CLOCK_REALTIME, &sys_time);
return (result == 0);
#endif
#endif

#ifdef PLATFORM_WIN32
SYSTEMTIME systime;
systime.wYear = time.year;
systime.wMonth = time.month;
systime.wDay = time.day;
systime.wHour = time.hour;
systime.wMinute = time.minute;
systime.wSecond = time.second;
systime.wDayOfWeek = 0;
systime.wMilliseconds = 0;
return SetLocalTime( &systime );
#endif
}
```

Hello Sergey,

The RPI linux doesn't already do something to manage this ??

RPI has no RTC (with an independent power supply) clock onboard.
Therefore the appropriate system call of setting of system clock leads to a procedure call of setting up of time on the real-time hardware clock. And as it's absent, the command is quietly ignored by system.
