If I drag a dock I can cover the left,top,right,bottom. But I want to be able to cover the center.

How do I do this?

Hi

You can use

Float(Dockable(treectrl2, "TreeCtrl 2").SizeHint(Size(300, 200)),Point(300,210));

In docking example. in place of
 DockRight(Dockable(treectrl2, "TreeCtrl 2").SizeHint(Size(300, 200)));

Float will make dock float and place it in center of your window.
Float(DockableCtrl& dc, Point p = Null);
Point p will position dock at top-left corner.

Hello deepack,

I may be mistaking, but I think what rxantos is expecting is some "eclipse" like docking.
Leaving a whole in the middle isn't very natural, you must be able to put something in it by drag'n'droping

From my point of view, this is the main default of the docking package which otherwise works quite well.
But because of this missing feature, it isn't usable in production applications.

This is exactly what I mean.
