There are so much duplicated files in U++ snapshot source...

File list attached.

Many duplicates in U++ source code means certainly bugs and out of date source. Perhaps in 2008 release...

So I went through the list and found nothing really meaningful or fixable.

There are 3 basic cases:

- 1 - files that NEED to be duplicate, like Copying file.
- 2 - 3rd party files.
- 3 - files in example codes. E.g. same DB schema for several example packages.

My bad. The long list is certainly an issue with my installation script. I found a lot of library sources inside U++ tarball and most of them are provided by Linux distributions too. I was too quick to

assume and report a problem.

The spec file is fixed now. Weird problem about directory creation that cause many duplicates (fixed in svn rev 10682).

upp-devel.spec is ready and working on several rpm based distributions now. Tested on:

Fedora (with gcc) Centos 7 (with clang++) Open Suse (with clang++) Redhat (if you manage to install clang++) A few other rpm based distribution (with clang++ too)

Cool thanks!

Any chance you could help with "bad GCC version" issue in tarball? And maybe with separate umk compilation?

I can change the domake script and force the use of clang++ instead of gcc if gcc version is lower than 4.9.0 for example.

I didn't found a quick fix for abs and other methods producing compilation errors with old gcc versions.
