Hello everyone, I have a new question for you

I have a mdb Database and I want to connect to it with U++ using ODBC.

So, I added the data source to ODBC32 Bit:

For User-DSN and System-DSN.

Name is anything, Platform is 32 Bit, Driver is Driver do Microsoft Access (\*.mdb) and also tried Microsoft Access Driver (\*.mdb)

Then, in my program, I use the following code:

(be aware that I use 2010 sources):

```
ODBCSession session;
```

```
if(!session.IsOpen())
```

```
{
```

```
String cs = Format("DRIVER=%s;SERVER=(local);Trusted_Connection=yes;", "something"); //
```

```
DRIVER is the same name as in ODBC data source, also tried {SQL Server}
```

```
if(!session.Connect(cs))
```

```
{
```

```
Cout() << session.GetErrorStatement() << "\n";
```

```
}
```

```
}
```

With DRIVER = "something" I get the error: [Microsoft][ODBC Driver Manager]The datasource was not found, no standard driver... (translated to english, original error message is german so may it's not 100% the right message)

With DRIVER = {SQL Server} I get: [Microsoft][ODBC SQL Server Driver][Shared Memory]SQL Server does not exist or connection refused  
and [Microsoft][ODBC SQL Server Driver][Shared Memory]ConnectionOpen (Connect())

I also tried disabling the firewall, with no success.

Am I missing something?

Please help me.

Thanks

Nevermind, just found it on my own...

There is no need for an ODBC Data connection, and no need for a firewall rule.

I simply changed my connection string to the following:  
connectionString = "Driver={Microsoft Access Driver  
(\* .mdb)};Dbq=C:\\path\\database.mdb;Uid=;Pwd=";

according to:

<https://www.connectionstrings.com/access/#net-framework-data-provider-for-odbc>

and it works.
