What I see happen often is that when I suspend my session with Thelde still open and then reopen my laptop in the morning, I get a popup and Thelde closes.
It doesn't always happen, but pretty often.

Hello,

I added corresponding redmine ticket #1667. Your description of the problem is not too big. Can you describe in what status is your ide - opened main package, compiling package etc. Moreover it would be nice to have some information about your computer setup - distribution, 32-bit vs 64-bit etc.

And finally, maybe you have got some clues that allow us to faster solve the problem. The code ones is the preferred way ;)

Sincerely and thanks for reporting ;),
Klugier

Theide would be open with a big project loaded. Lots of files and lots of packages. I would have been typing and compiling and running and then suspend the session for the next. When I open the laptop the next day and click on theide on the taskbar to de-minimize the window, there is a popup with a red icon. The caption is "Error - KDialog" and the text is : Fatal Error. Invalid Memory Access. When I click ok theide closes.

Hello,

I cannot reproduce on my machine with KDE (Kubuntu 16.04 - new KDE (5 rather than 4). Can you also try to update your build to the latests stable or nightly build and try to reproduce. I believe without strong logging infrastructure, it will be hard to diagnose.

Of course, I am some kind of Eco guy and don't want to keep my machine in hibernation mode over the night for testing purpose ;)

Sincerely,
Klugier
