**Description**

Example:

```
<html>
____<body>
_____<p></p>
____<body> <!-- Probably here user need to reverse identation - or detect this situation and remove indent from begining -->
</html>
```

__ - 4 _ means one identation

Production version added.

Not everything is working, but the main core is implemented. Moreover the class IdentRecognizer is added to not duplicate code.

There is a typo in this implementation:

- It should be Indent instead of Ident? - What do you think in CodeEditor code we have functions like GetLineIdent?
