Description

http://www.ultimatepp.org/forums/index.php?t=msg&goto=45945&#msg_45945

The file libpq-fe.h can be located in /usr/include/posgresql/ (Debian, Ubuntu) or directly in /usr/include (Arch, CentOS, Fedora, Rosa, Slackware, OpenMandriva, Mageia). I think the only universal solution is to #include <libpq-fe.h> on all platforms and distros and fix it by adding /usr/include/postgresql to library paths. I'm aware this might break existing installations, but I don't see any way to detect the correct location of the file at compile time.
